

Men who get fit in middle age can halve their risk of strokes

Men who get fit in middle age can halve their risk of strokes

[Full original article in The Telegraph]

"Middle-aged men who throw themselves into fitness can halve their risk of strokes, research suggests. Scientists said those with sedentary lifestyles had been able to transform their heart health in just seven years - protecting them three decades later.

Norwegian scientists tested the fitness of 1,400 men who were in their 40s and 50s at the start of the trial.

Most became less active as middle age set in, but one in three upped their efforts.

When they compared the group who boosted their fitness the levels the most with those who saw the greatest decline, they found startling differences.

Some of the best results were achieved among those who started out as couch potatoes.

The group with the biggest increase were 56 per cent less likely than the group which slowed down the most to suffer a stroke in later life.

Overall, one in eight had a stroke in the following 28 years, the study by the University of Oslo found...."
